# Flight Readiness Review Presentation

### Alabama Rocket Engineering Systems (ARES) Team The University of Alabama

THE UNIVERSITY OF ALABAMA®

### Overview

- Mission Overview
- Team Introduction
- Launch Vehicle Design
- Payload Design
- Project Plan
- Q & A

### **Mission Overview**

- Launch vehicle must carry payload to 5,280 ft AGL
- Payload must eject from launch vehicle
- Payload must analyze images of the ground to detect potential landing hazards
- Payload must steer away from detected landing hazards
- All components of the rocket must be safely recovered.

### **Team Introduction**

### Launch Vehicle Design

### Alabama Rocket Engineering Systems (ARES) Team The University of Alabama

#### THE UNIVERSITY OF ALABAMA®

![](_page_8_Picture_0.jpeg)

### Launch Vehicle Dimensions

![](_page_8_Figure_2.jpeg)

![](_page_9_Picture_0.jpeg)

# Key Design Feature - Fins

- Fins size based on creating a favorable stability margin
- Fin tabs are epoxied to the centering rings and motor mount tube
- A fillet of epoxy is between the fin face and the aft body tube

![](_page_9_Figure_5.jpeg)

Vehicle Design

Ο

![](_page_10_Picture_0.jpeg)

# Key Design Feature - Motor Mount

- Motor Mount contains and stabilizes the motor during flight
- Centering rings are epoxied onto the motor mount tube and the aft body tube. They are placed to give the fins extra support

Vehicle Design

Ο

![](_page_10_Figure_4.jpeg)

![](_page_11_Picture_0.jpeg)

## Key Design Feature - Bulkhead

- Bulkheads provide eye bolts for parachute attachment
- Electronics bay bulkheads protect altimeters from adverse pressure changes
- Black powder cups are epoxied onto the electronics bay bulkheads

Ο

![](_page_13_Picture_0.jpeg)

Vehicle Design

### **Final Motor Choice**

The original motor selection from CDR was a Cesaroni Technology Pro 75 3300L3200-Vmax

Updated to the final selection of the Pro75 3683-L851-P once the ARES team had to test the L851 due to the L3200 shipping issues

After testing both motors, the L851 put the rocket closest to the 5280 ft mark and gives the team and vehicle the best opportunity for success

The Cesaroni Pro75 3683-L851-P is available through "Chris' Rocket Supplies, LLC"

![](_page_14_Picture_0.jpeg)

## **Rocket Stability**

- Center of gravity and center of pressure of the rocket are located 56.40 and 68.27 inches (1.433 and 1.734 m) from the tip of the nose cone
- Stability Margin: 2.14 calibers

![](_page_14_Figure_4.jpeg)

![](_page_15_Picture_0.jpeg)

## T/W Ratio and Rail Exit Velocity

| Thrust-to-Weight Ratio                    | 4.97          |
|---|---------------|
| Rail Exit Velocity (ft/s)                 | 55.8          |
| Rail Height (ft)                          | 12            |
| Static Stability Margin (off launch rail) | 2.02 calibers |

Vehicle Design O Payload Design O

![](_page_16_Picture_0.jpeg)

## Mass Statement & Margin

- Observed a 3.71% increase in mass
- OpenRocket full scale simulation vs mass of actual rocket mass

Vehicle Design

| Component                 | Mass (Ib)      |
|---------------------------|----------------|
| Nose Cone                 | 4.06           |
| Forward Body Tube         | 4.5            |
| Aft Body Tube             | 2.23           |
| Motor Mount               | 2.41           |
| Fins                      | 1.86           |
| Payload                   | 7.0            |
| Electronics Bay           | 2.69           |
| Main Parachute (Packed)   | 2.81           |
| Drogue Parachute (Packed) | 1.5            |
| Motor w/ Propellant       | 8.35           |
| Motor Propellant          | 4.84           |
| Simulation Total          | 37.0           |
| Actual Total Measured     | 38.4           |
| O Pavload Design          | O Project Plan |

## Kinetic Energy at Landing

Maximum kinetic energy of any individual section: 75 ft-lb

 $v = \sqrt{\frac{2*KE}{m}}$ 

Vehicle Design

Descent Rate Calculator (fruitychutes.com)

| System                  | Mass (lbf) | Allowable<br>Velocity (ft/s) | Minimum Parachute<br>Diameter (in) | Drag Reduction<br>Velocity from<br>Minimum<br>Parachute (ft/s) |
|-------------------------|------------|------------------------------|------------------------------------|--|
| Nose Cone               | 4.06       | 34.49                        | 24                                 | 27.52  |
| Forward Body<br>Section | 11.5       | 20.49                        | 60                                 | 18.53  |
| Aft Body Section        | 10.95      | 21.00                        | 54                                 | 20.09  |
| Total Rocket            | 26.51      | 13.50                        | 115                                | 13.22  |

Project Plan

A 120 inch (3.08 m) main parachute for the total descending rocket is justified to safely land each independent section under the 75 ft-lb

Ο

Payload Design O

![](_page_18_Picture_0.jpeg)

### **Predicted Altitude**

- OpenRocket simulation predict altitudes of 4874 ft
- Actual full scale flight test reached an altitude of 5415 ft
- Percent difference of 6.97 %
- Within this range flight will successfully complete the mission

| Simulation              | Apogee (ft) | Max Velocity<br>(ft/s) | Time to<br>Apogee (s) | Flight Time<br>(s) |  |
|-------------------------|-------------|------------------------|-----------------------|--------------------|--|
| Bragg Farms<br>(0 mph)  | 4874        | 562                    | 18.6                  | 119                |  |
| Bragg Farms<br>(5mph)   | 4854        | 561                    | 18.6                  | 118                |  |
| Bragg Farms<br>(10 mph) | 4802        | 561                    | 18.5                  | 117                |  |
| Bragg Farms<br>(15 mph) | 4727        | 559                    | 18.3                  | 116                |  |
| Bragg Farms<br>(20 mph) | 4659        | 558                    | 18.2                  | 116                |  |

![](_page_19_Picture_0.jpeg)

### **Predicted Drift**

Drift calculations were performed in OpenRocket at the latitude, longitude, and altitude of Bragg Farms in Huntsville, Alabama. The current calculations are from a 700 ft. main deployment altitude with a main parachute diameter size of 120 in.

| Wind Speed                   | 0 mph | 5 mph | 10 mph | 15 mph | 20 mph |
|------------------------------|-------|-------|--------|--------|--------|
| Max Lateral<br>Distance (ft) | 9.24  | 215.6 | 502.3  | 812.3  | 1273.6 |

![](_page_20_Picture_0.jpeg)

### **Test Plans and Procedures**

Ground Tests

- Charge tests ensure clearance from the launch vehicle
- Correct amount of black powder is determined

Sub-Scale Test

• The sub-scale flight proved that the recovery system is adequate and that the design of the rocket is stable in-flight

Full-Scale Test

Vehicle Design

• The full-scale flight proved that all aspects of the launch vehicle function properly

![](_page_21_Picture_0.jpeg)

Vehicle Design

# Full Scale Flight Test

- The data obtained from the L851 and L3200 full scale flight by the Stratologger CF Altimeters are featured in the next two slides.
- The data proves validates our Descent Rate Calculator, (fruitychutes.com), showing that the 75 ft-lb limit was not exceeded.
- Two successful ejections of the payload at apogee show a successful integration of the payload with the launch vehicle.
- Successful ground ejection tests and recovery on flights have finalized the process and procedures for preparation and launch.

![](_page_22_Picture_0.jpeg)

## Full Scale Flight Test Summary

| Motor | Simulation Altitude<br>(ft) | Actual Altitude (ft) | % difference |
|-------|-----------------------------|----------------------|--------------|
| L851  | 4874                        | 5415                 | 9.99%        |
| L3200 | 4566                        | 4876                 | 6.36%        |

![](_page_25_Picture_0.jpeg)

### Recovery

The recovery system is governed by 2 Stratologger CF altimeters

- Powered by 2, 9 volt D batteries
- Altimeters wired to a 2 screw switches
- Each altimeters sends a charge to black powder cup on either side on the electronics bay
- Backup charges are set off at a lower altitude
- A dog tracker GPS will relay position of the launch vehicle upon landing

A 26" drogue parachute and a 120" main parachute will be ejected from rocket at apogee and 700 ft, respectively

![](_page_27_Picture_0.jpeg)

# Staged Recovery Test

Workshop Tests

• Altimeters tested in vacuum container to verify readings are being taken

Ground Tests

- Checklists for tests have been and will be followed to ensure safety
- 3 feet rule is used to determine if ejection was successful

Full Scale and Subscale

Vehicle Design

• The 2 full scale flights and the subscale flight illustrated the ability of the recovery system

![](_page_28_Picture_0.jpeg)

## Vehicle Requirements Verification

All requirements have been verified by the successful full scale launches

Full requirement verification table can be found in the FRR document

Vehicle Design

| #   | Requirement  | Design Feature                                     | Verification  | Verification<br>Status |
|-----|--|--|---|------------------------|
| 1.1 | The vehicle shall deliver the<br>payload to an apogee altitude of<br>5,280 feet AGL  | Launch Vehicle<br>Structure and<br>Motor Selection | OpenRocket<br>simulations,<br>Subscale Launch,<br>and 2 Full Scale<br>Test Launches | Verified               |
| 1.3 | The launch vehicle shall be<br>designed to be recoverable and<br>reusable  | Launch Vehicle<br>Structure                        | Subscale and full scale launch tests  | Verified               |
| 2.1 | The launch vehicle shall stage<br>the deployment of its recovery<br>devices, where a drogue<br>parachute is deployed at apogee<br>and a main parachute is deployed<br>at a much lower altitude | Recovery System                                    | Ground tests,<br>subscale and full<br>scale launch<br>tests                         | Verified               |
| 2.3 | At landing, each independent<br>section of the launch vehicle<br>shall have a maximum kinetic<br>energy of 75 ft-lb  | Parachutes   | OpenRocket<br>simulations,<br>kinetic energy<br>calculations                        | Verified               |

**Project Plan** 

O Payload Design O

![](_page_29_Picture_0.jpeg)

### Launch Vehicle Interfaces

Motor mount

- Centering rings will be epoxied to motor mount tube and aft body tube
- The motor retainer is secured into the aft most centering ring

Fins

- Fin tabs epoxied onto motor mount tube between centering rings
- Fin-motor mount tube assembly slid into aft body tube and be epoxied
- Extra fiber glass epoxied onto aft body tube and fins using "tip-to-tip" method

Ο

![](_page_29_Figure_9.jpeg)

Vehicle Design

![](_page_30_Picture_0.jpeg)

### Launch Vehicle Interfaces

Electronics Bay

- Electronics bay housing is a phenolic tube; fits tightly inside forward body tube
- Secured by four screws
- Two screw switches used to turn altimeters on

### HAL Payload

- Payload will sit inside the forward body tube, on top of the drogue parachute
- Payload diameter: 5.3 inches

Vehicle Design

• Body tube inner diameter: 5.38 inches

![](_page_30_Figure_10.jpeg)

![](_page_31_Picture_0.jpeg)

## Launch Vehicle Interfaces

Section Interfaces

- Coupler is epoxied into the aft body tube; forward body tube will slide on and be secured by four shear pins
- Nose cone shoulder will slide into forward body tube and be secured by four shear pins

Launch Rail

• Rail buttons will fit a 1515 rail

Vehicle Design

• 12 ft rail will be used to maximize exit stability

Ο

• The apparent angle of attack will lower the static stability margin to 2.02 calibers

![](_page_32_Picture_0.jpeg)

Vehicle Design

# **Payload Integration**

The HAL payload loads into the forward body tube

- The payload sits directly forward of the drogue parachute
- The payload rests inside the body tube like the shoulder of the nose cone
- The lander leg design has been configured to allow the best possible ejection from the forward body tube

![](_page_33_Picture_0.jpeg)

## **Payload Integration**

The HAL payload will withstand temperature flux from the black powder charges. The max temperature experienced is 73.8 degrees Fahrenheit.

### Alabama Rocket Engineering Systems (ARES) Team The University of Alabama

THE UNIVERSITY OF ALABAMA®

![](_page_56_Picture_0.jpeg)

### **Budget Overview**

Current Projected Budget: \$7,980.77

Increases are attributed to additional components and expedited shipping.

| Report                 | Budget Total             |  |  |
|------------------------|--------------------------|--|--|
| Proposal               | \$7,454.12               |  |  |
| PDR                    | \$7,188.32               |  |  |
| CDR                    | \$7,607.52               |  |  |
| FRR                    | \$7,980.77               |  |  |

### **Educational Outreach**

The ARES Team has reached a total of 1553 students through educational outreach

• 583 of these students were reached directly through activities pertaining to rocketry

The team partnered with SEDS to hold a bottle rocket competition for three local middle schools
